

From the Ground to the Cloud: Innovative Mobile, Cloud and Web-Mapping Technologies for Chimpanzee Conservation

Lilian Pintea, PhD
VP Conservation Science
the Jane Goodall Institute
lpintea@janegoodall.org

Outline

- Conservation Needs:
 - Empower local communities to monitor their forests and wildlife
 - Minimizing the costs of technology use
 - Managing, accessing and using very high resolution satellite imagery
 - Collaboration and sharing across partners with different technical capacities
- Next steps: scaling up and integration towards operational platforms and decision support systems

The Jane Goodall Institute

Mission Focus:

To protect with partners 85%
of chimpanzees and their
habitats in Africa

Vision:

A viable, diverse and stable
population of chimpanzees
living in peaceful coexistence
with human communities

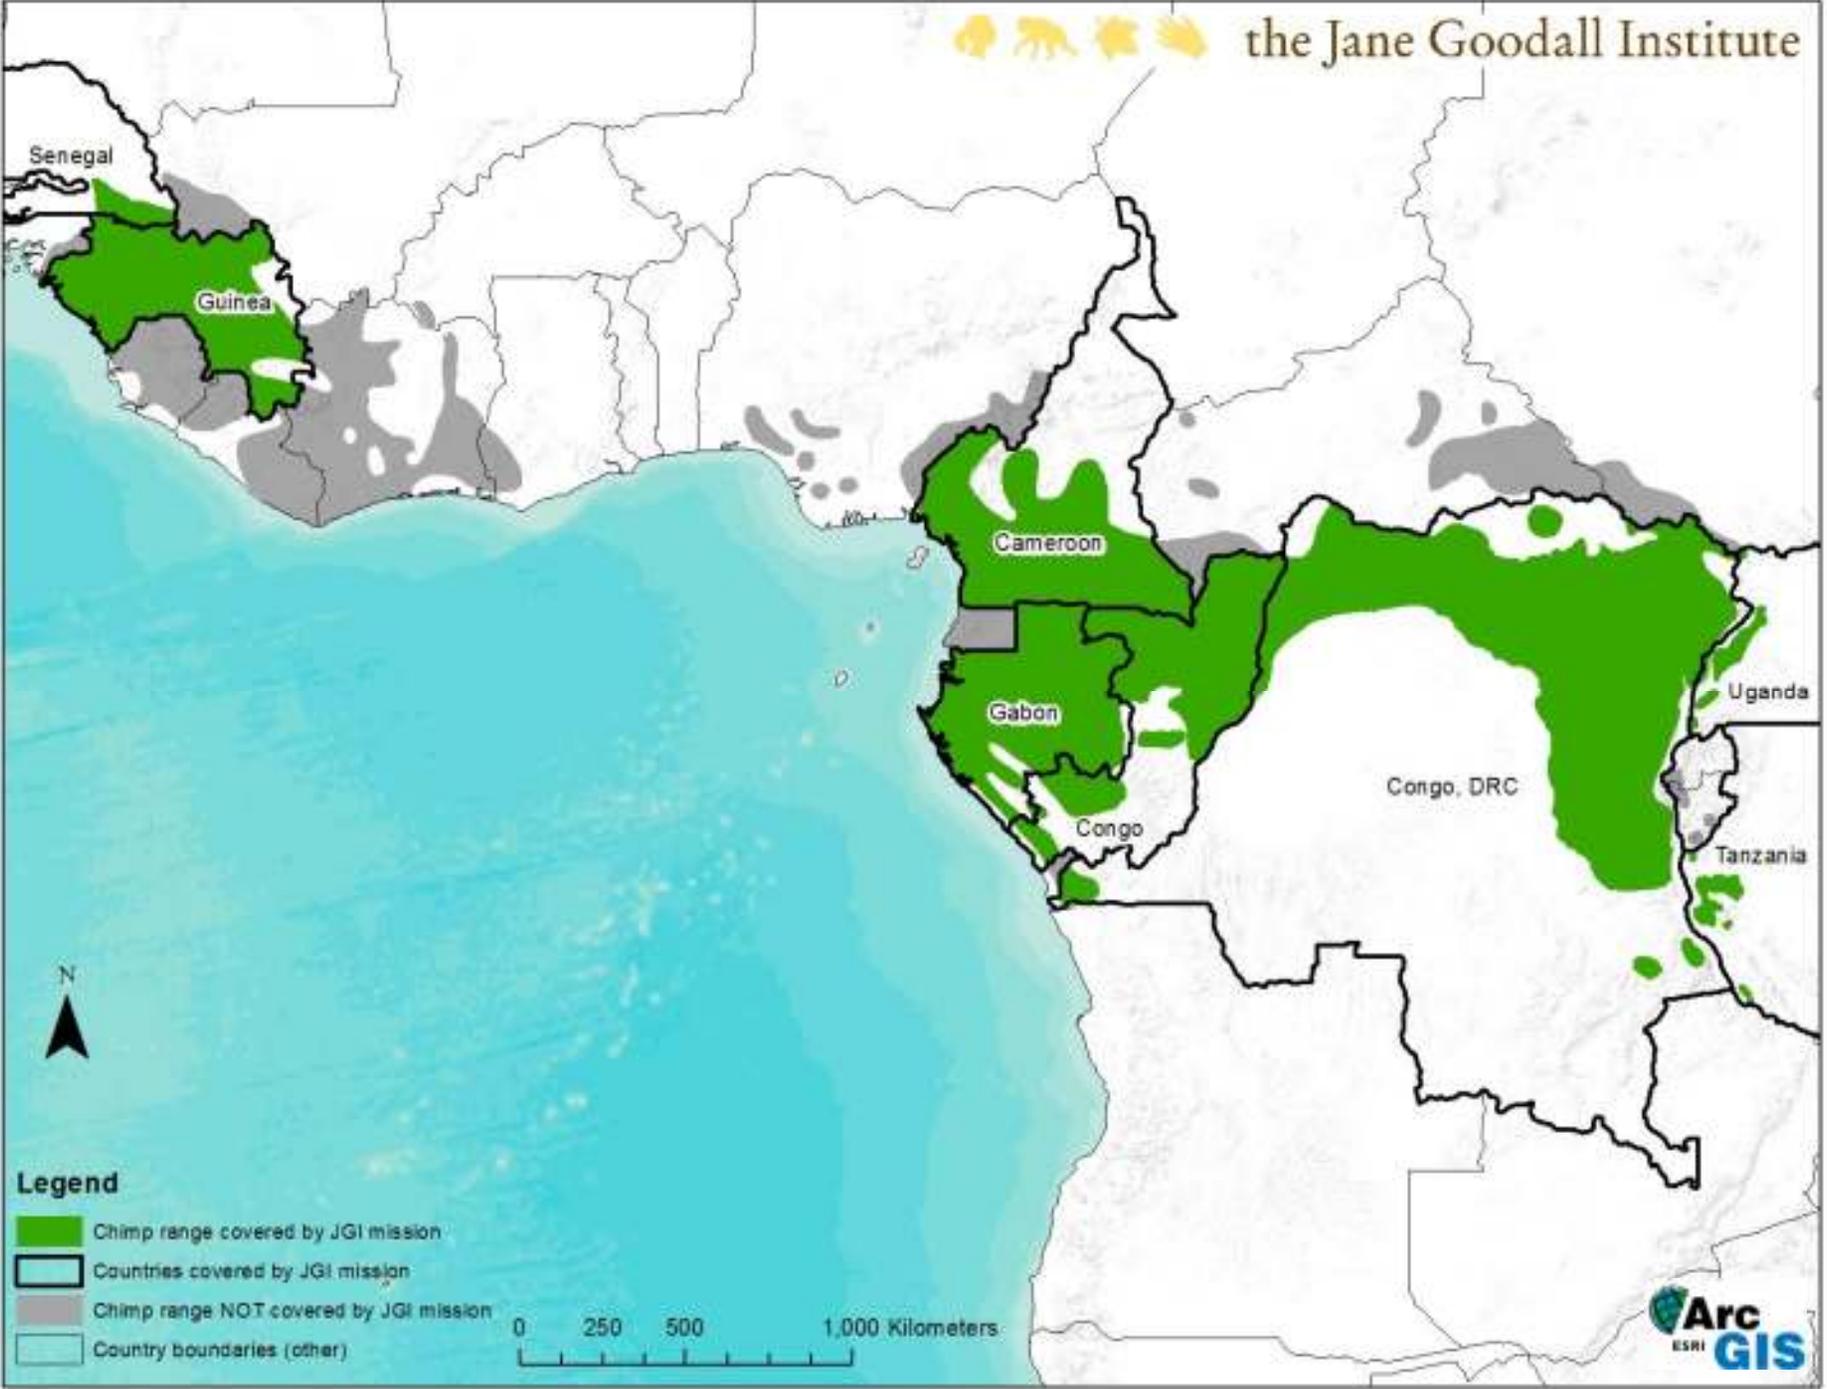

**The Jane Goodall Institute for Wildlife
Conservation, Research and Education
(founded 1977)**

What began with Dr. Jane Goodall's
pioneering work at Gombe Stream
Reserve in Tanzania in 1960, has grown
over the years into a global not-for-profit
organization.

- Chimp range covered by JGI mission

Integrating Geospatial Technologies and Local Knowledge: participatory mapping using 1-meter IKONOS satellite imagery in 2003

Garmin GPS limitations

- In 2005-06, 16 FM's collected more than 36,000 observations as part of USAID funded Greater Gombe Ecosystem project;
- Most of the attributes were on paper and not feasible to be digitized, visualized, analyzed or shared;
- Need for a different mobile data collection approach.

Presented at UNFCCC COP-15, 2009 in Copenhagen

Subscribe

The video player displays a central globe with three red dots and connecting lines. The dots are labeled: 'Surui people' (in the Amazon region), 'UN Climate Change Conference' (in Europe), and 'JGI program' (in East Africa). The Amazon Conservation logo is in the top left, and the Jane Goodall Institute logo is in the top right. Two inset photos are shown: 'Almir Surui' on the left and 'Jane Goodall' on the right. The bottom of the player shows a progress bar at 6:40 / 7:23, a volume icon, a Creative Commons license icon, and a resolution of 360p. The Google logo and copyright information are visible at the bottom right of the video frame.

Data Analysis

- Export in CSV
- Microsoft Excel (edit, clean)
- Esri ArcGIS desktop / GDB format
 - Clean (e.g. remove duplicates)
 - Create unique line patrol paths IDs (village name – month-day-year)
 - ODK data and patrol paths with 1 km grid
 - Calculate encounter rates for each 1 km grid (frequency of observations / sum of km patrolled)
 - Produce maps

Data Catalog

Workspace

A planetary-scale platform for environmental data & analysis

Google Earth Engine brings together the world's satellite imagery — trillions of scientific measurements dating back almost 40 years — and makes it available online with tools for scientists, independent researchers, and nations to mine this massive warehouse of data to detect changes, map trends and quantify differences on the Earth's surface. Applications include: detecting deforestation, classifying land cover, estimating forest biomass and carbon, and mapping the world's roadless areas.

To learn more, view [product videos](#) and the Featured Gallery (below). Or visit the [Data Catalog](#) to explore our archive of satellite imagery. Certain features (such as data download) are restricted to members of our trusted tester program.

New! Congratulations to the Landsat program on 40 years of continuous Earth observation! [Learn more...](#)

Earth Engine API

Develop, access and run algorithms on the full Earth Engine data archive, all using Google's parallel processing platform.

The Earth Engine API is currently available as a limited release to a small group of partners. If you are interested in developing on the Earth Engine platform, [let us know](#).

Featured gallery

We have precomputed a number of interesting datasets using the Earth Engine platform, below. Click on each to learn more and preview the data as a global time-lapse or as a layer in a Google Earth client.

Growth of Las Vegas: Timelapse

Interactive Landsat timelapse of urban expansion and water resources in the Nevada desert.

Amazon Deforestation: Timelapse

Interactive Landsat timelapse of deforestation of the Amazon rainforest, 1999-2011.

Drying of the Aral Sea: Timelapse

Interactive Landsat timelapse of the drying of the Aral Sea

Seasonal Earth Timelapse

Interactive, MODIS timelapse of the planet. Weekly composites make seasonal dynamics visible.

Global Roadless Areas: 1 km buffer

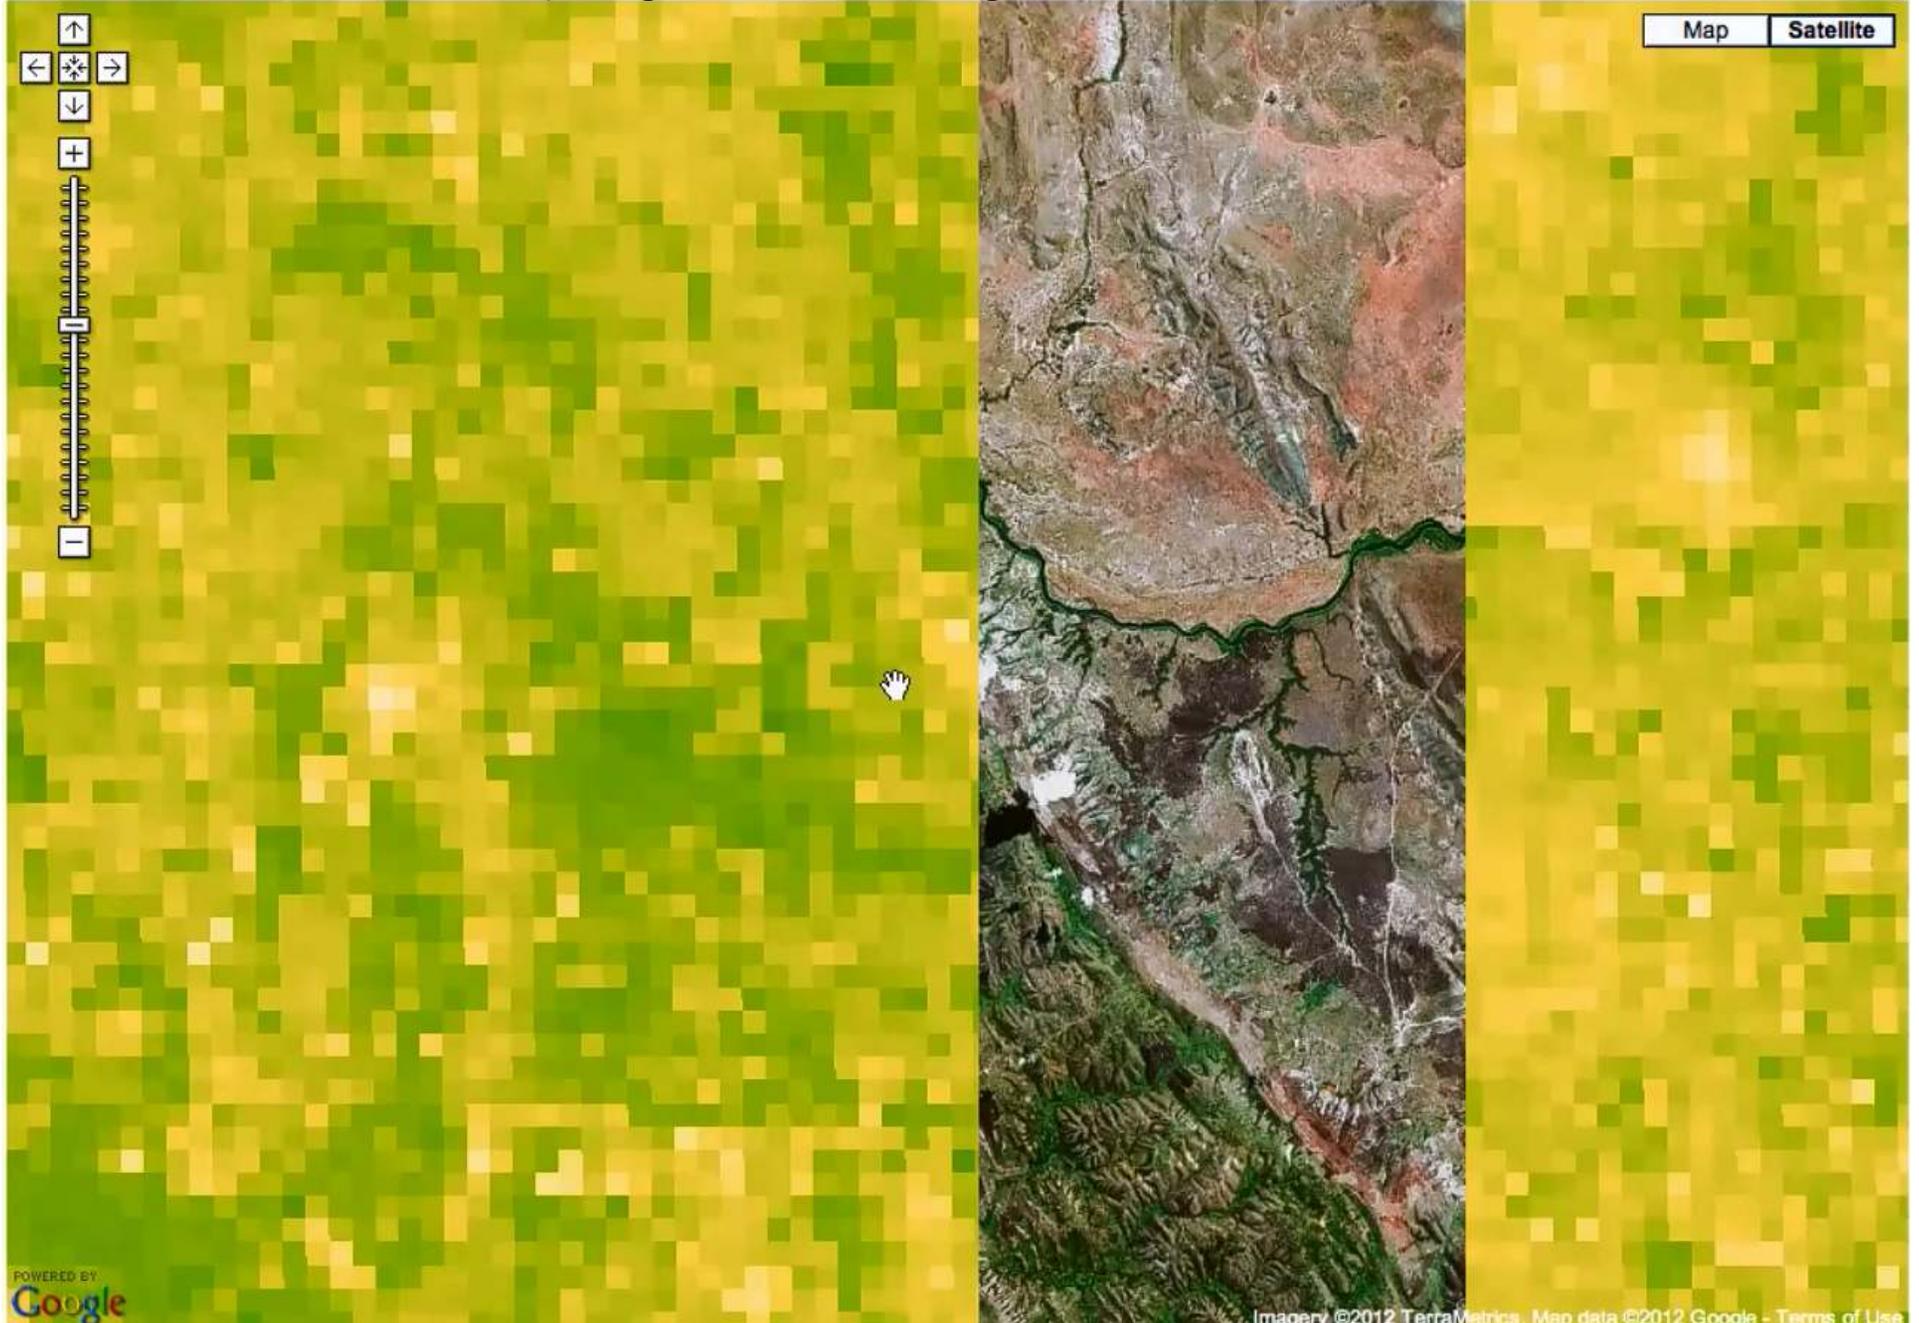

All areas of land more than one (1) kilometer from the nearest road, rail or navigable waterway.

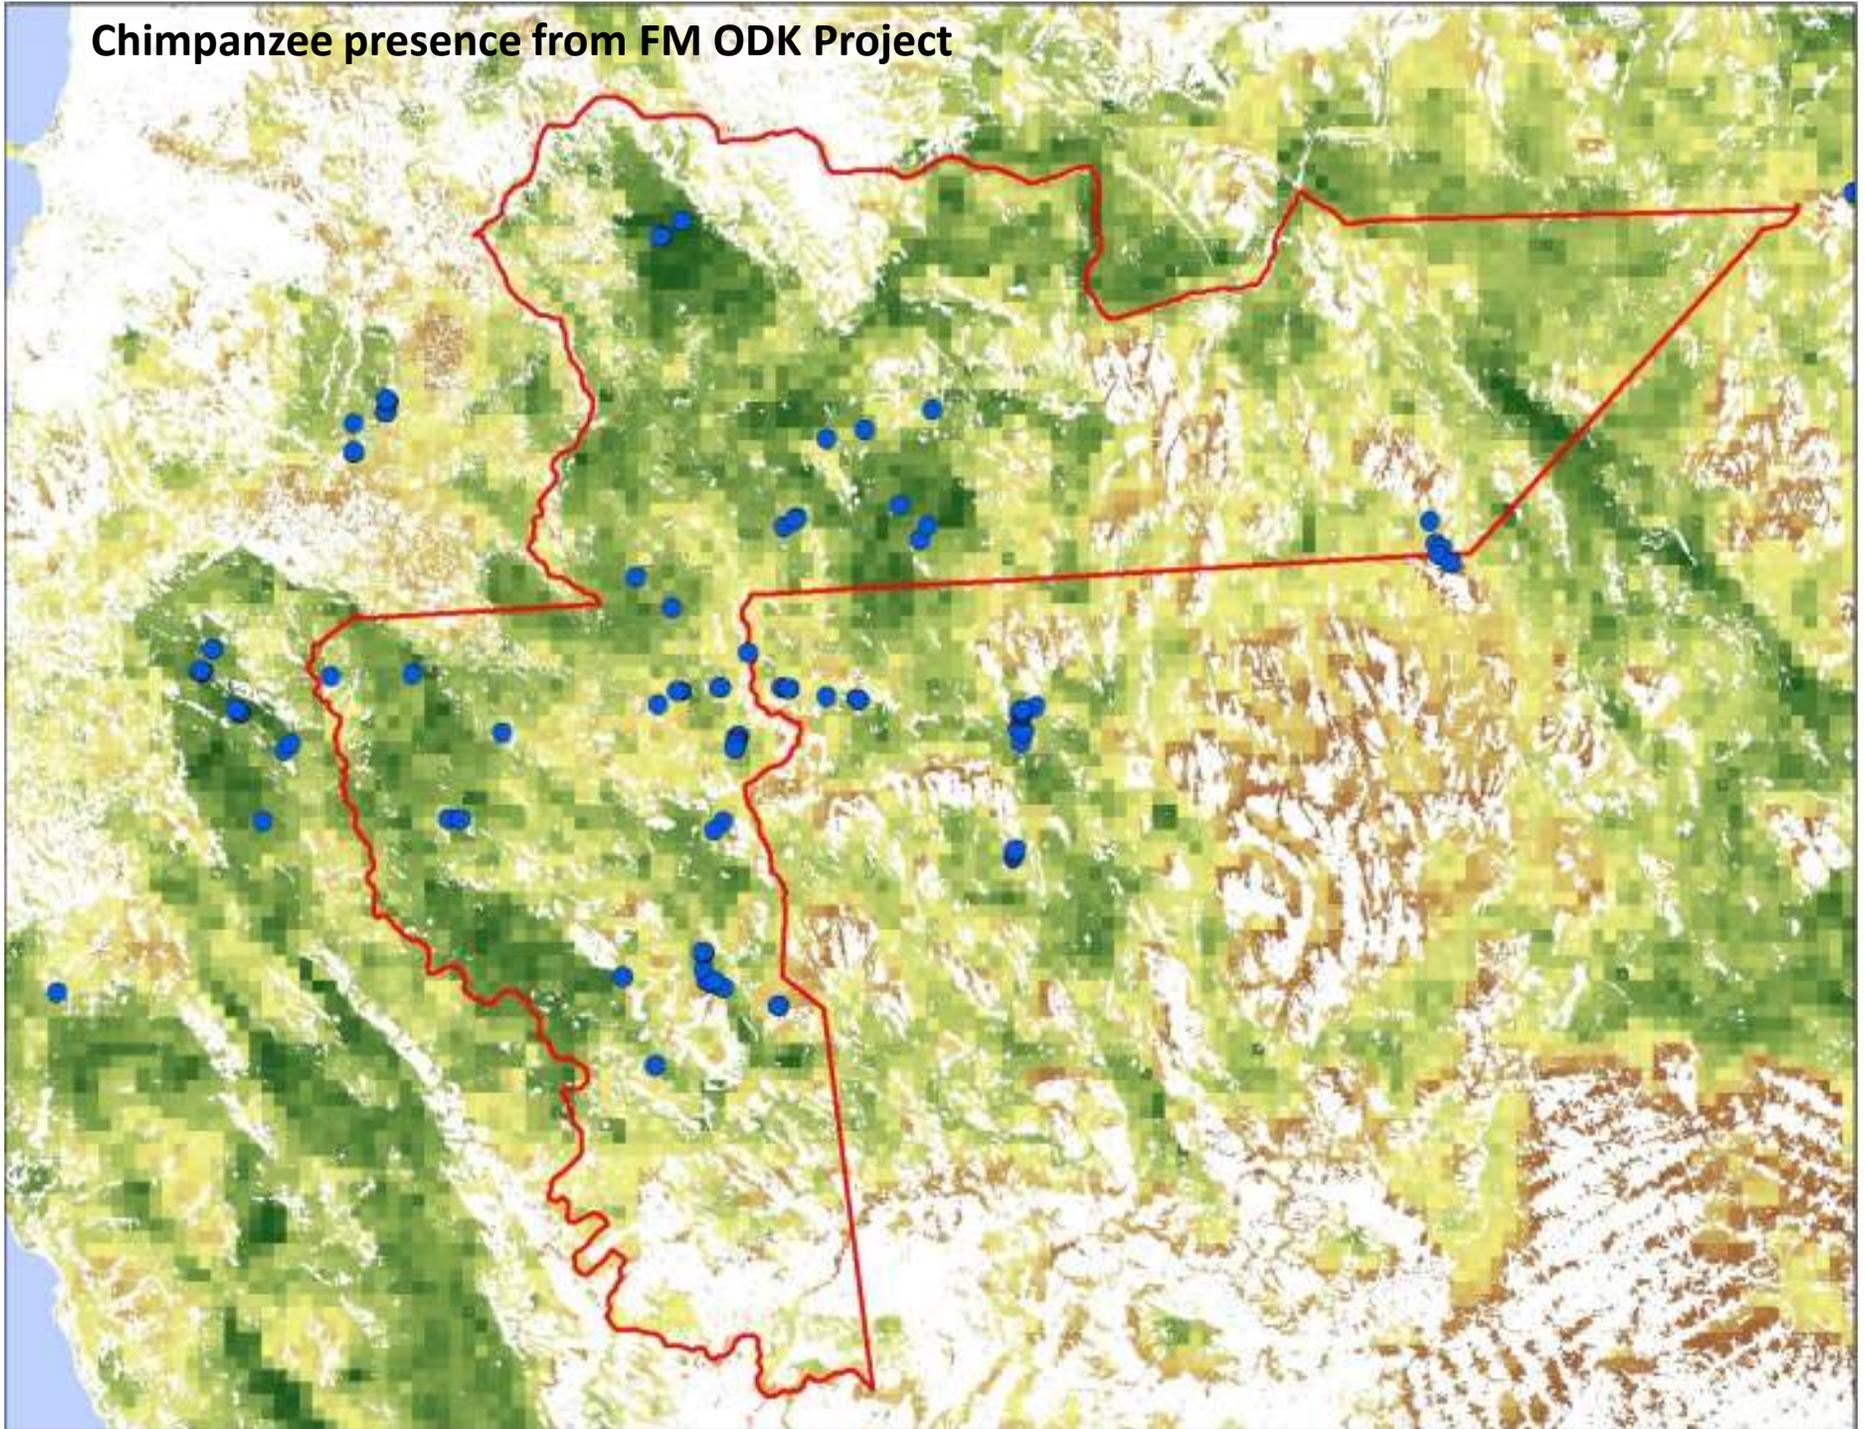

Global Roadless Areas: 10 km buffer

All areas of land more than ten (10) kilometers from the nearest road, rail or navigable waterway.

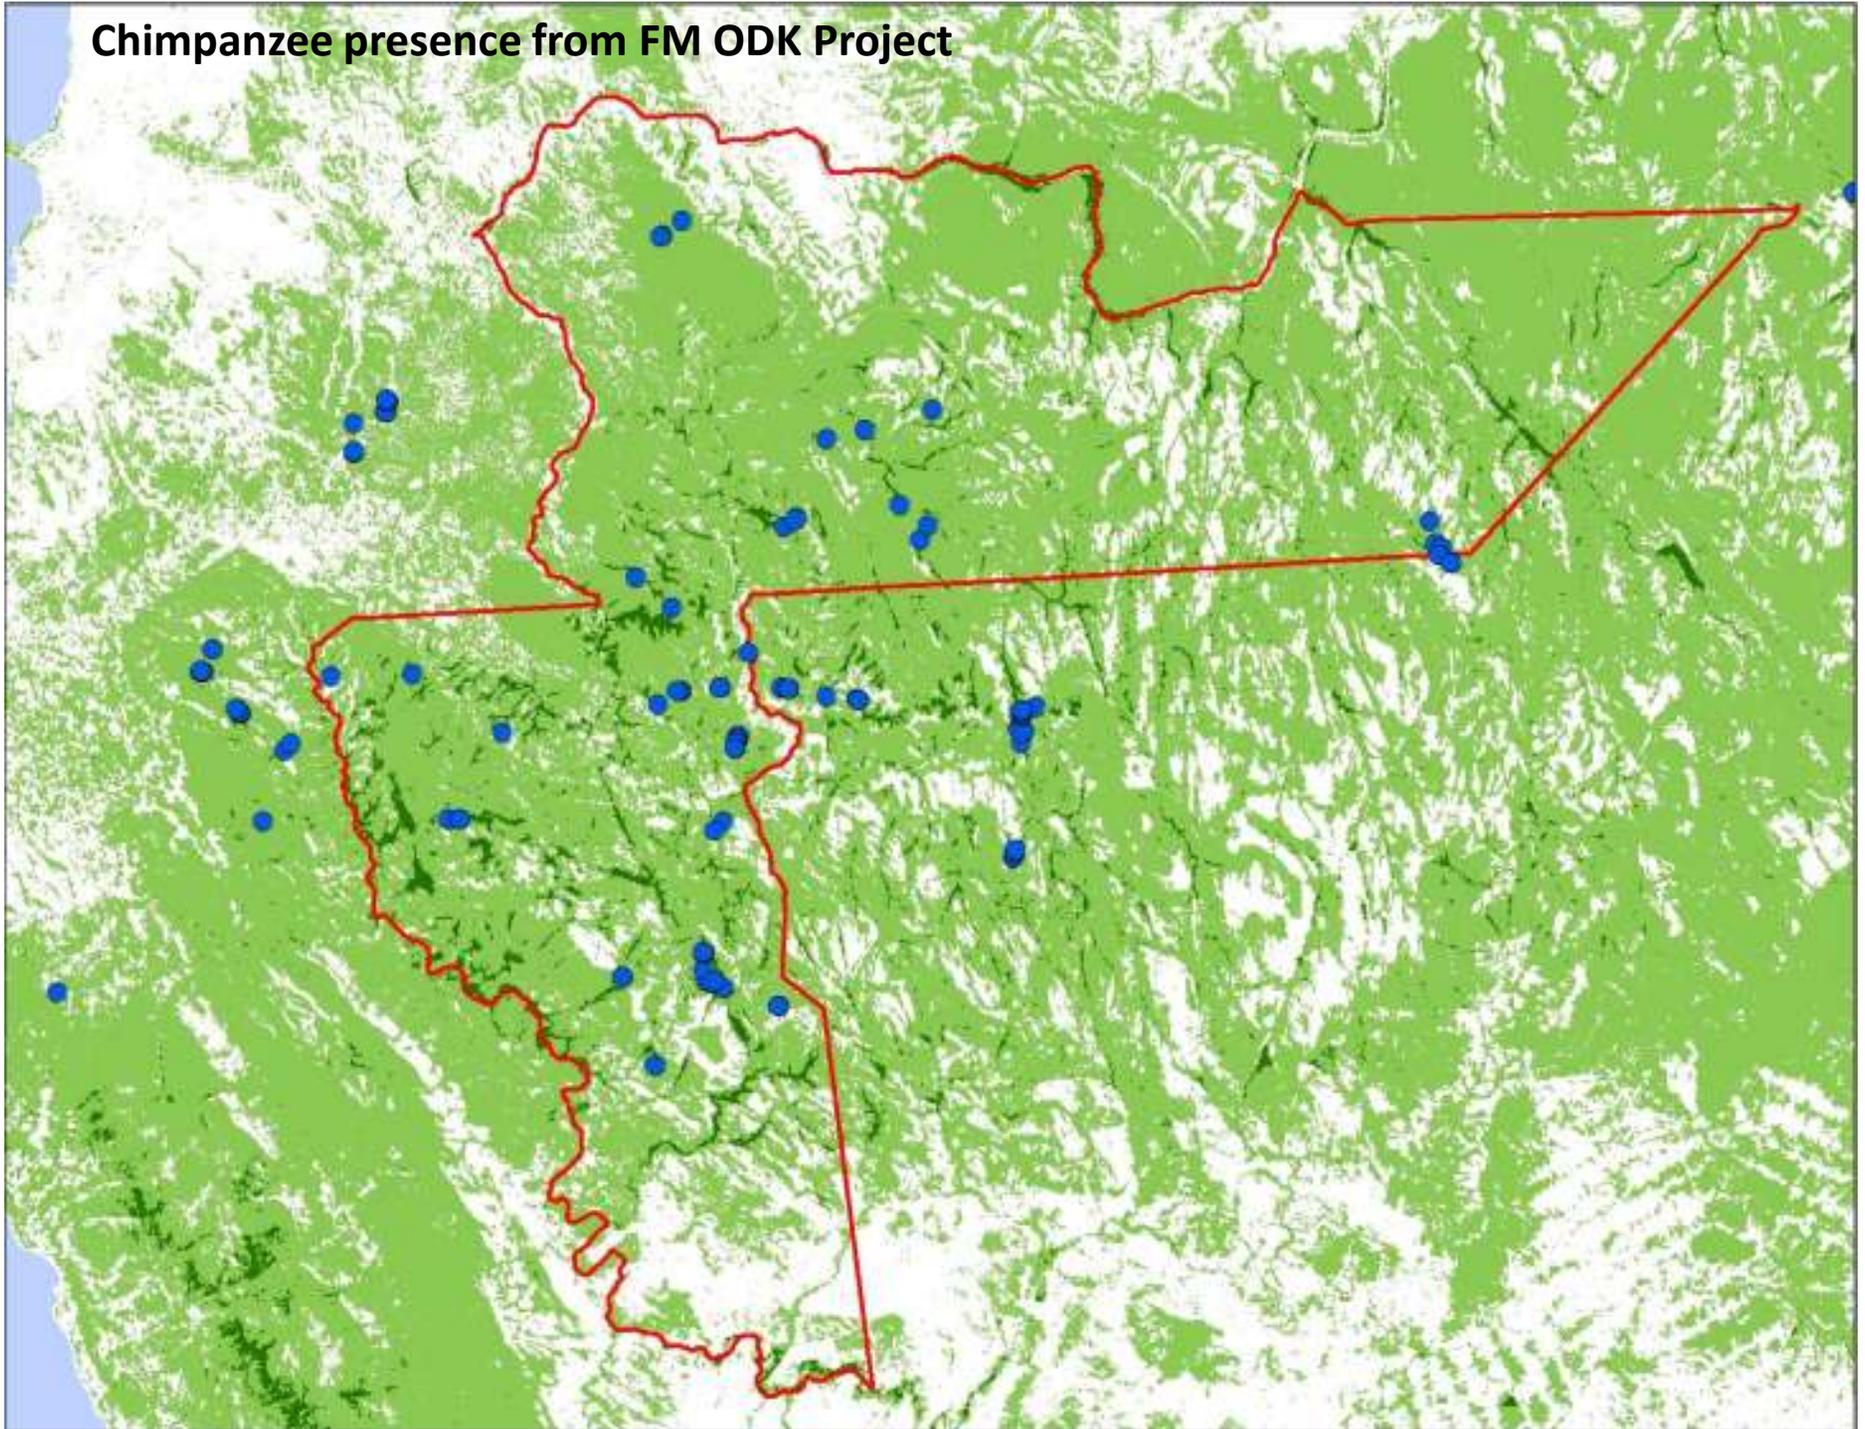

Biomass values calculated dynamically in Google Earth Engine using Baccini et al, 2012 Biomass Model, Woods Hole Research Center (dark green areas show higher biomass)

Chimpanzee presence from FM ODK Project

Chimpanzee presence from FM ODK Project

Chimpanzee Distribution Modeling in Google Earth Engine cloud: Refined potential chimpanzee nesting habitats using 2 years of Landsat satellite data

Screenshots of mahalanobis distance modeling workspace in Earth Engine. Note chimpanzee nests overlay over NDWI composites from Landsat satellite imagery

The screenshot displays the Google Earth Engine interface. The browser address bar shows the URL `jgi-mahal.appspot.com/#workspace`. The page header includes the Google logo, a search bar, and navigation links for Home, Data Catalog, and Workspace. A notification indicates the workspace was saved 12 minutes ago. The left sidebar lists various data assets and models, including Fusion Tables, Landsat NDWI and NDVI composites, and trained models. The main map area shows a satellite view of a forested region with a blue and yellow color scheme representing water indices. Numerous red circular markers are overlaid on the map, representing chimpanzee nests. The bottom of the browser window shows several open tabs, including Frankfurt.png, Travel Reservation N..., and habitat types for Lilian.doc.

Screenshots of mahalanobis distance modeling workspace in Earth Engine. Note oil palms on the high resolution imagery

The screenshot displays the Google Earth Engine workspace interface. At the top, the browser address bar shows the URL `jgi-mahal.appspot.com/#workspace`. The Google logo and search bar are visible, along with navigation links for Home, Data Catalog, and Workspace. The workspace title is "Earth Engine" and it indicates the workspace was saved 16 minutes ago.

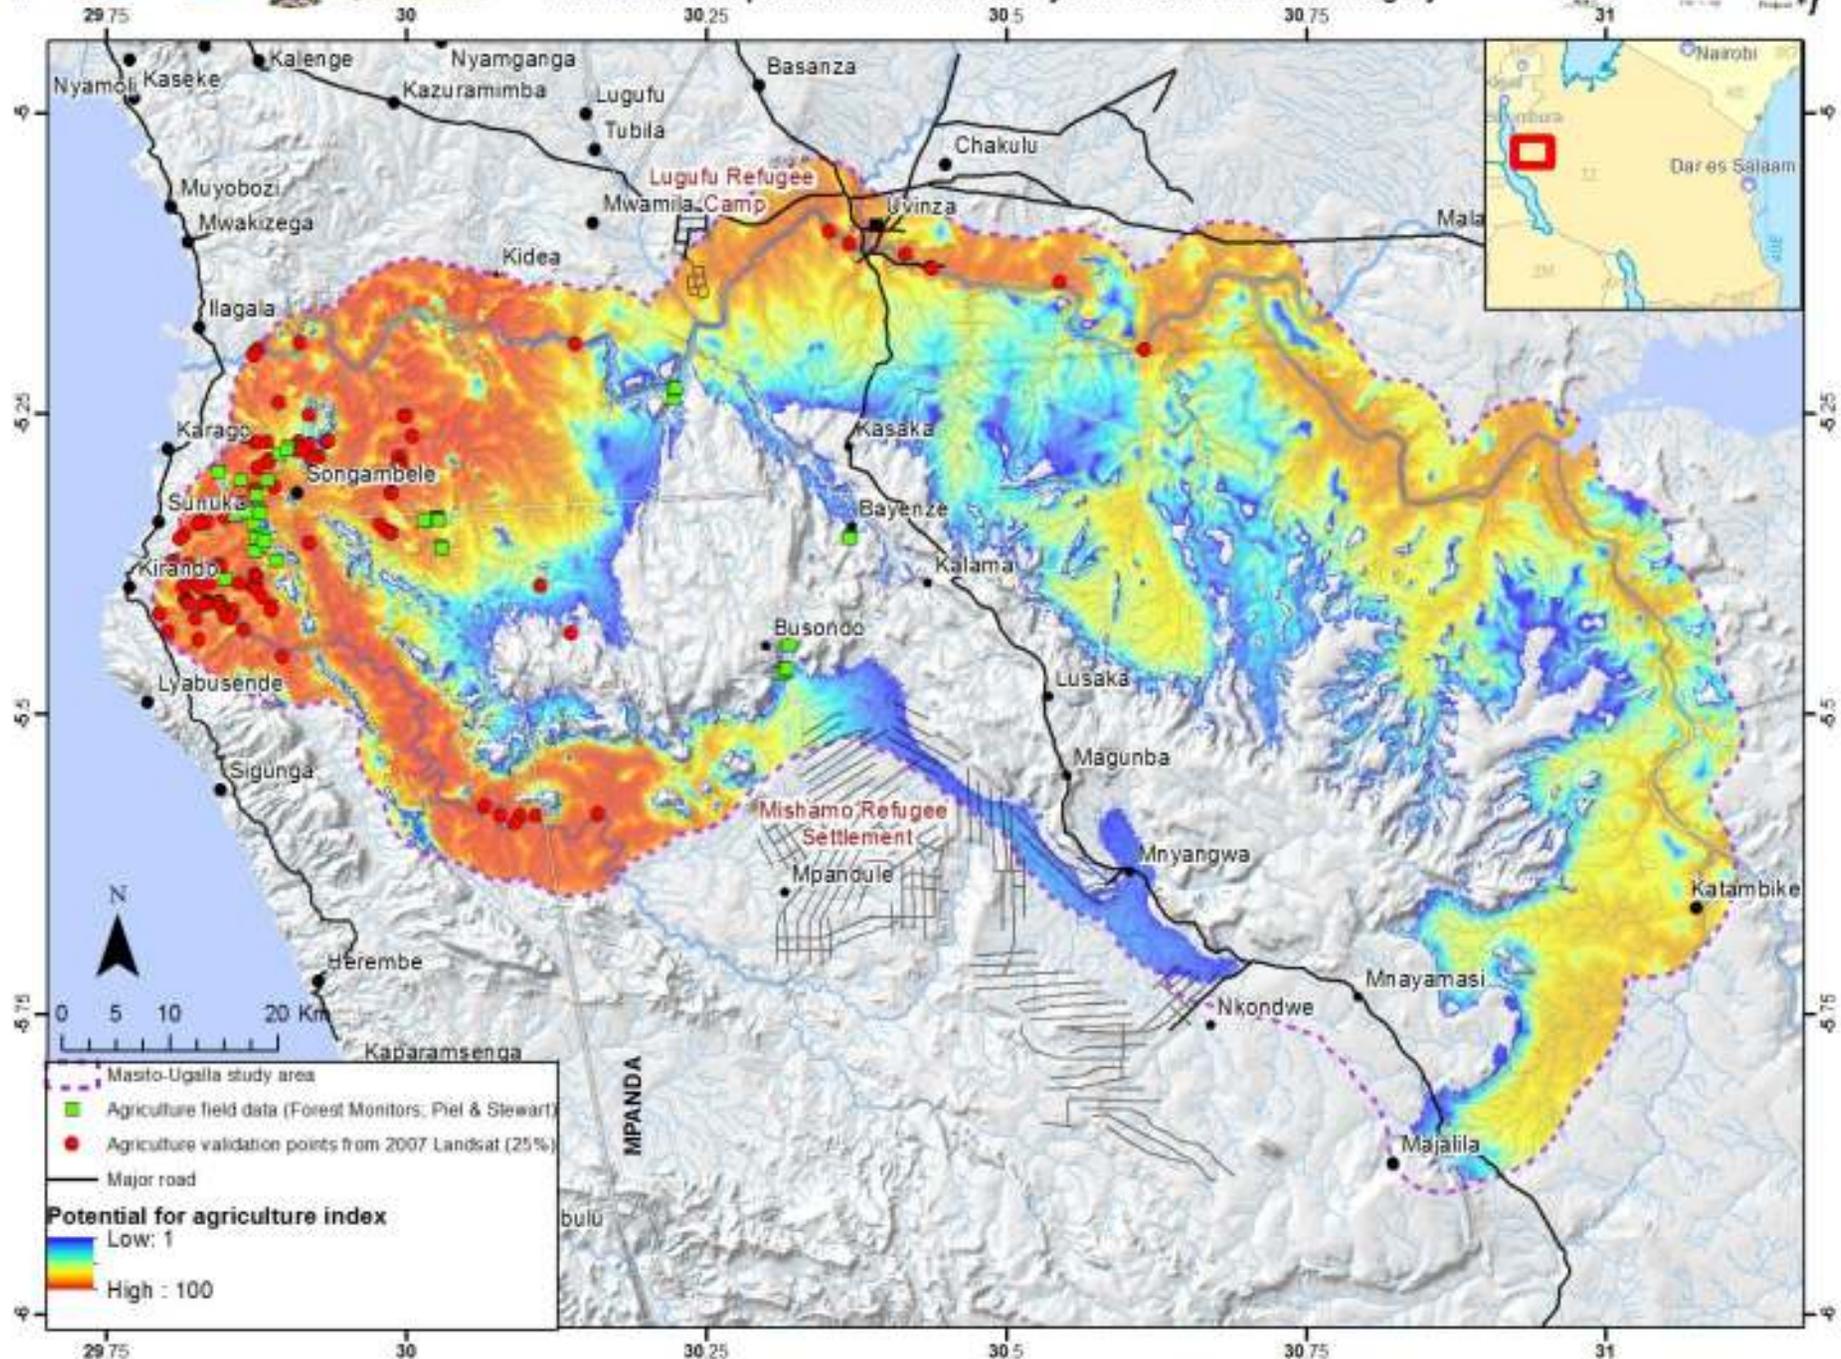

The left sidebar lists the following data assets:

- Fusion Table: `chimp_model_d2`
- Landsat 7 32-Day NDWI Composite
- Landsat 5 32-Day NDWI Composite
- Model, trained Nov 19, 2012 at 6:24am

Explore the world of wild living apes, find out where they live, which threats they face, and help to protect them

[IUCN/SSC - A.P.E.S. - A multi-partner initiative of the ape conservation community](#)

Bonobos, chimpanzees, gibbons, gorillas and orangutans are the closest relatives to humans living on earth today. They arouse intense fascination in humans due to the close genetic, behavioral, cultural and emotional similarities they share with us. Nevertheless, in a world with an ever increasing demand for food, land, timber and mineral resources, wild living apes are put under enormous pressure and their populations are declining rapidly.

A.P.E.S. allows you to explore the geographic areas where apes still occur in the wild using interactive mapping software, to help you better understand the various threats they face and to learn more about their conservation needs by using the various analytical tools provided. Of all the threats faced by apes, humans may be a large part of the problem, but we can also be the solution, use A.P.E.S to help save the apes!

sites.

Dashboard

Use the suite of tools provided within the Dashboard to guide conservation actions by exploring the relative pressures impacting species living in important ape

News

Try the new and easy to use data request function to access survey data with one click of the mouse

Did you know...

That there are 280 protected areas in Africa and Asia in which apes occur.

ODK data visualized in Google Earth: note the patrol bias along the ridges and footpaths.

FM data in Google Earth: house and farms in Riverine Forest Masito, Tanzania

The screenshot shows the Google Earth Pro interface. The main view is a 3D model of a house and farm in a forested area. A yellow pin is placed on the house, and a pop-up window displays the following information:

[Nyumba, Mpya, kama, mwaka, umepita]

[Nyumba, Mpya, kama, mwaka, umepita]

start	Tue May 29 10 26 53 UTC 2012
end	Tue May 29 10 26 48 UTC 2012
description

2012 Forest Watch Deforestation Alerts in the Bugoma-Budongo Corridor REDD project area

One of the dozens of Private Forest Owners Associations organized by JGI-Uganda and mapped using Google Android tablets, ODK and ArcGIS/Esri technologies

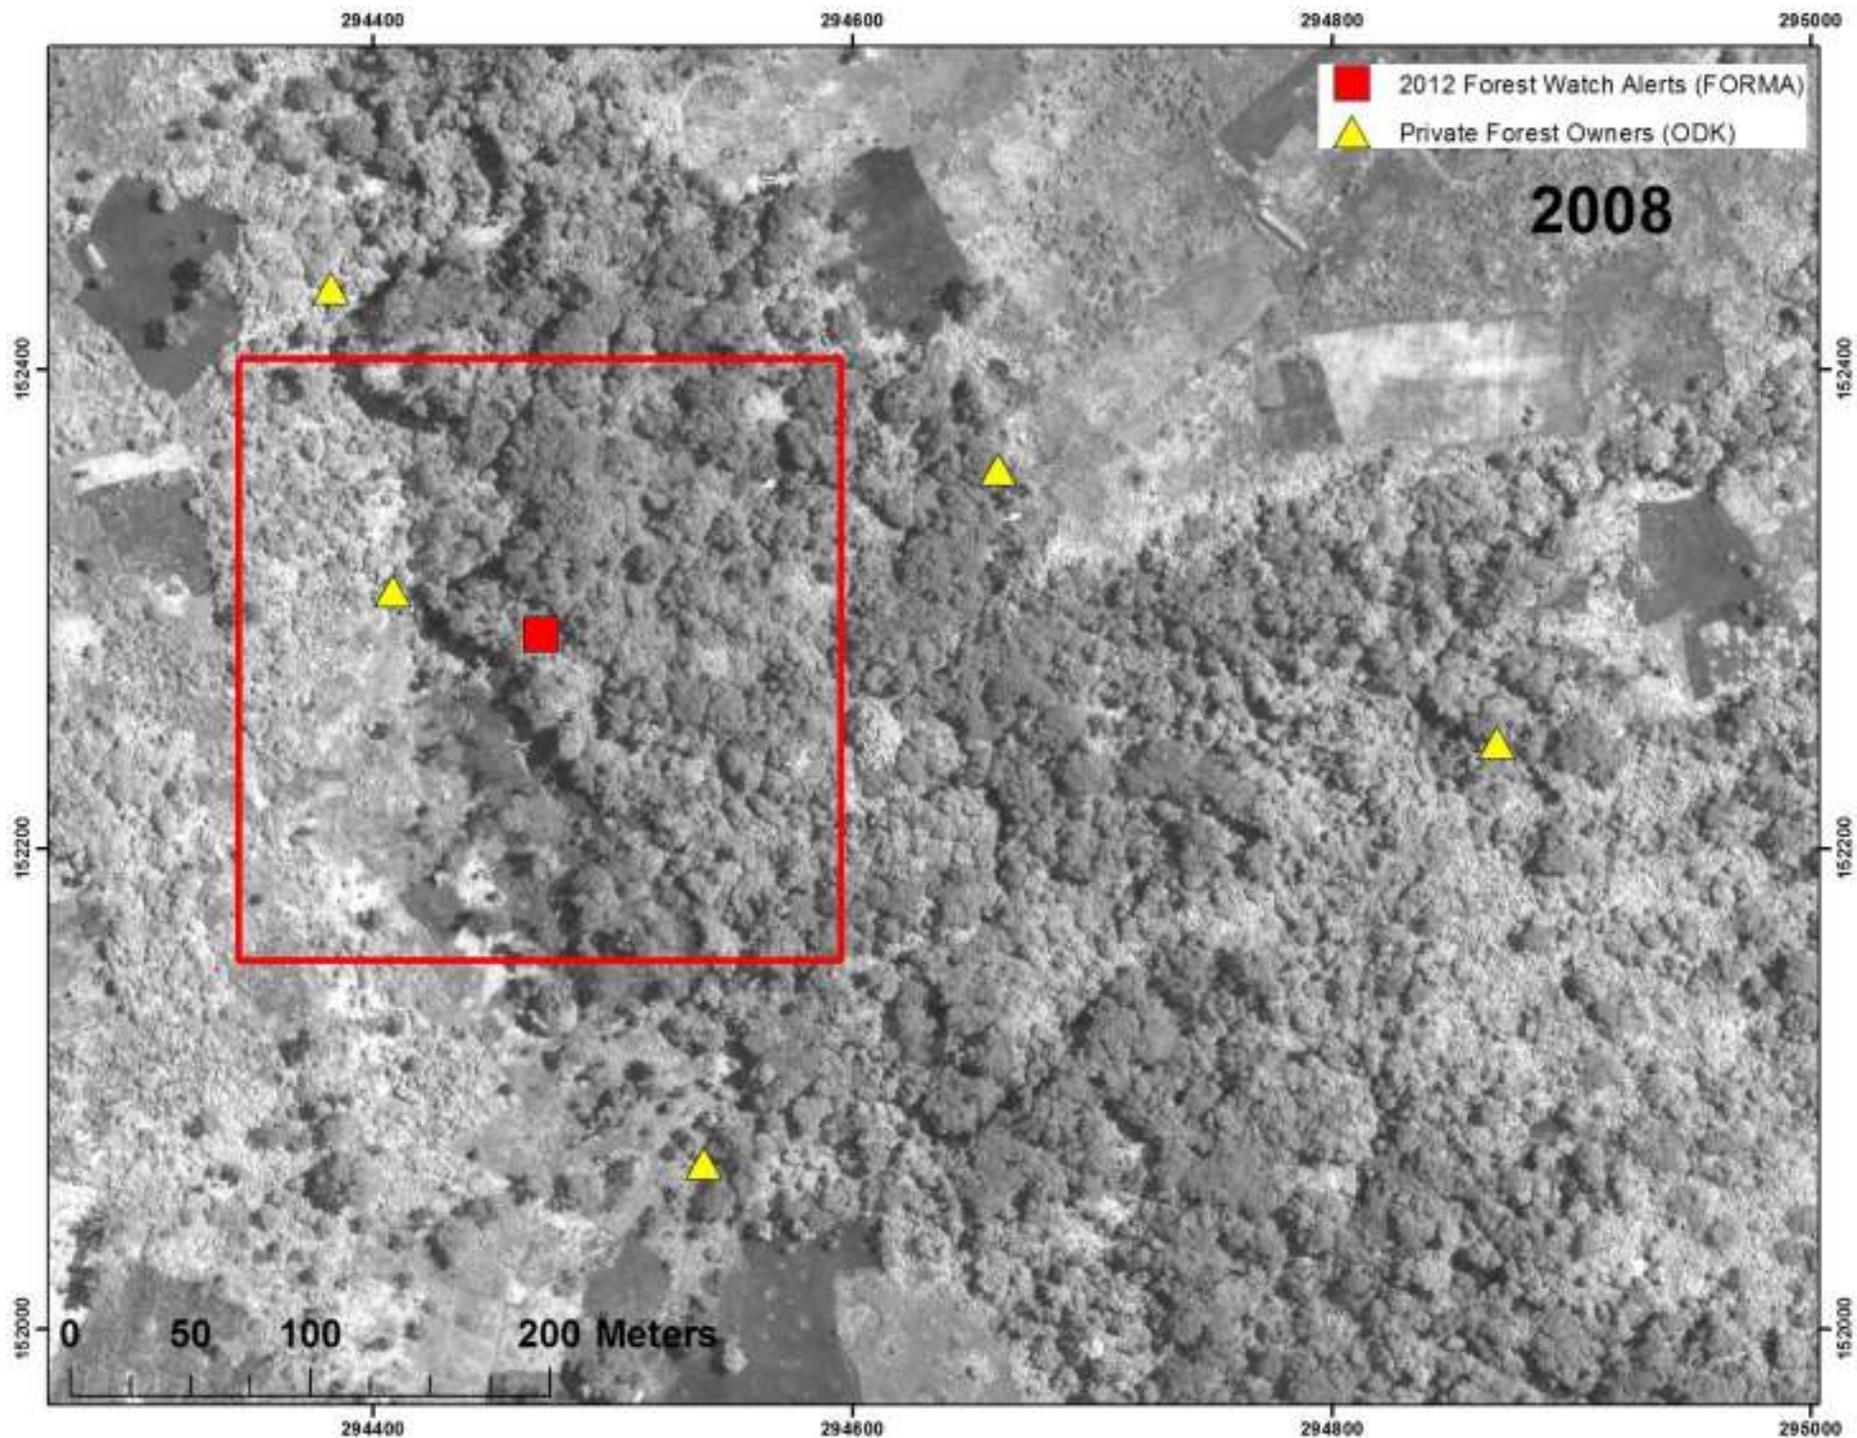

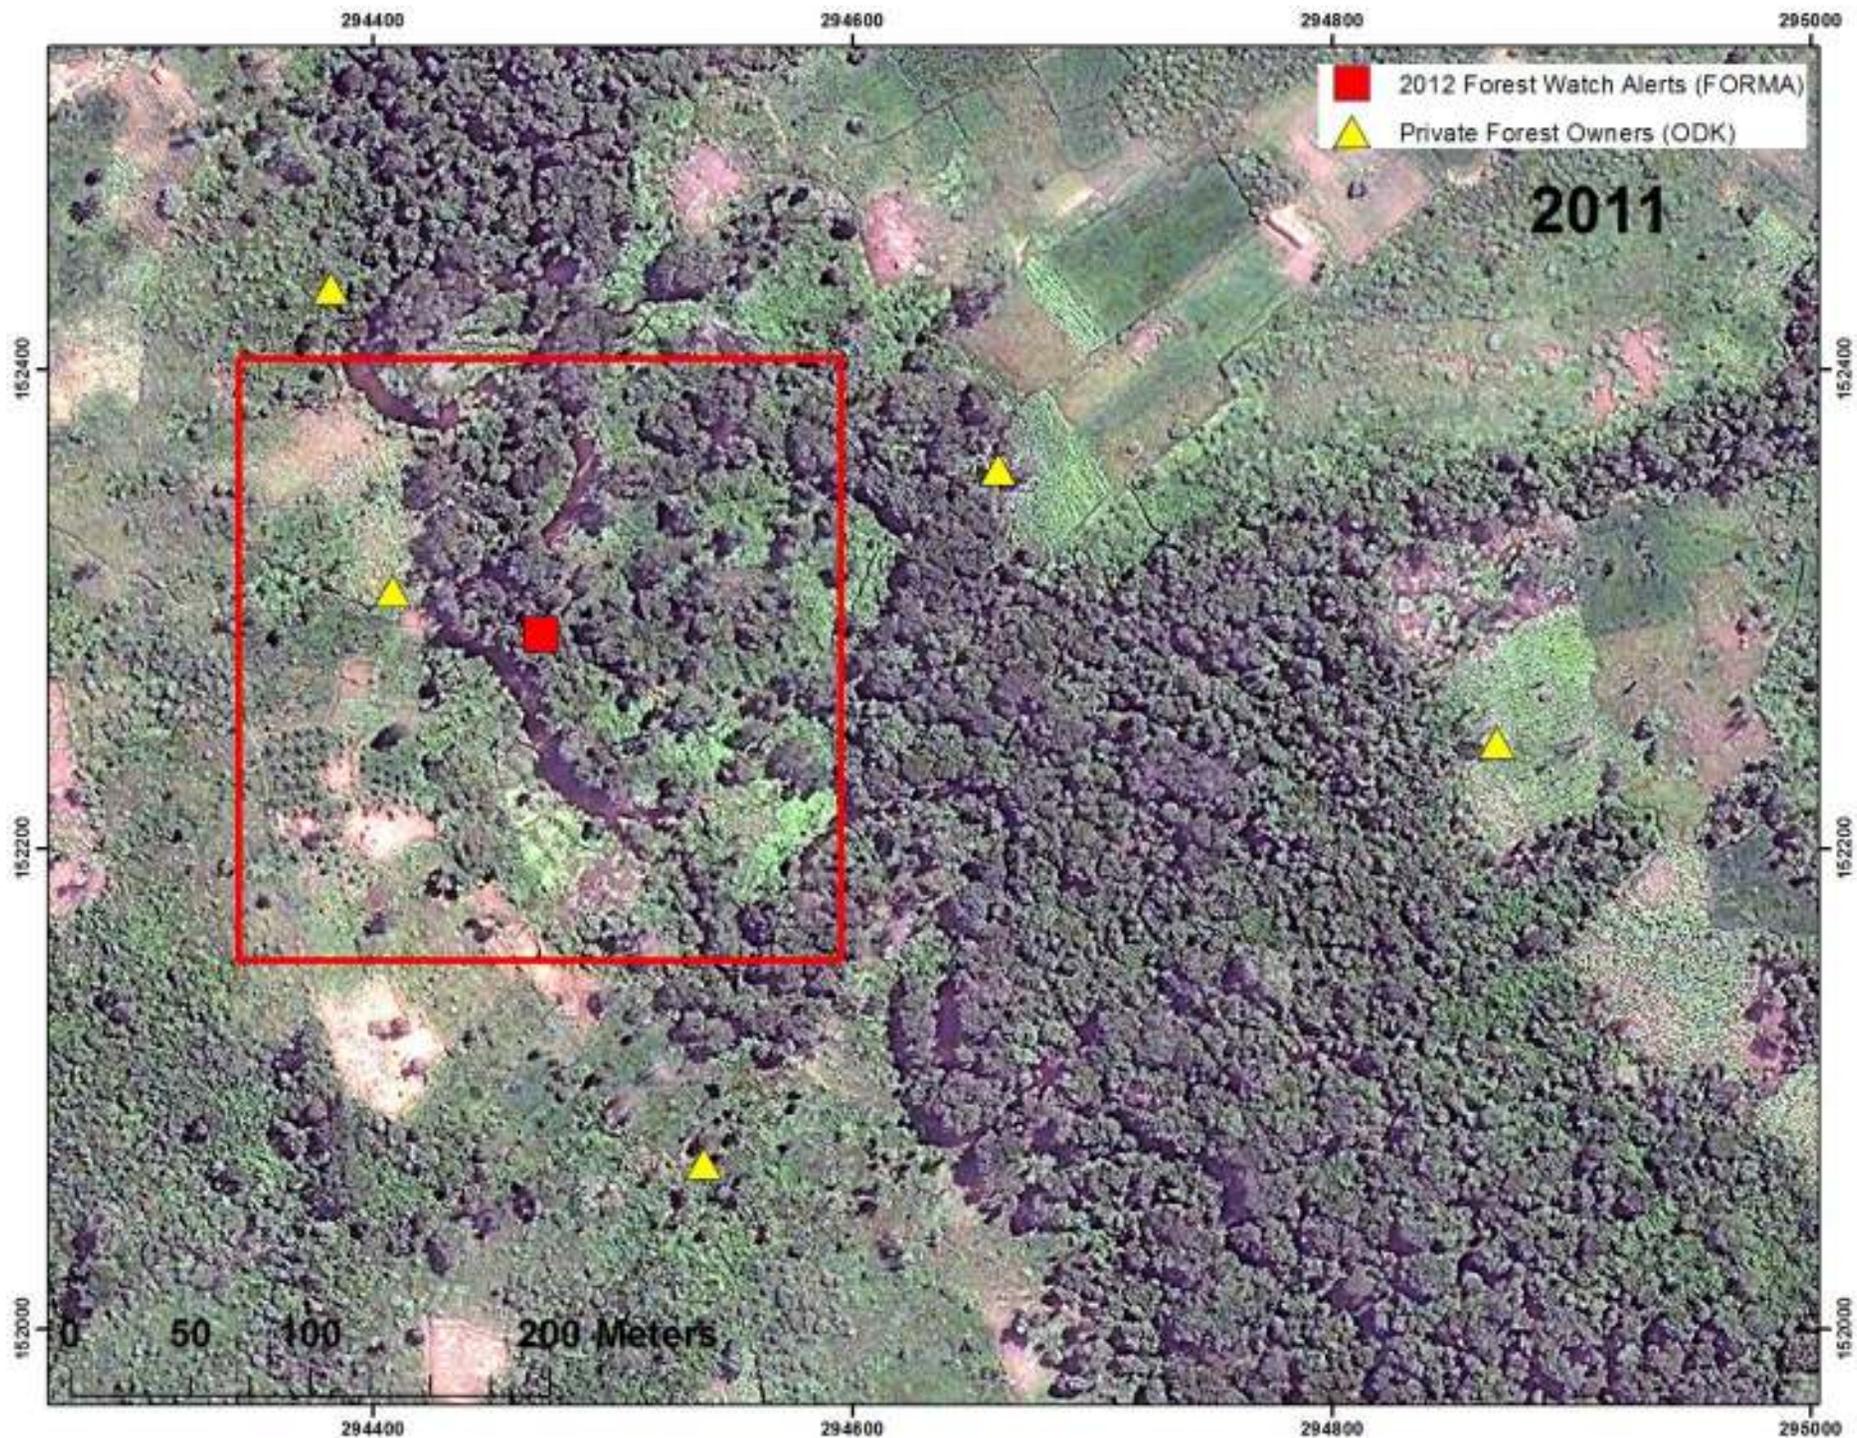

the Jane Goodall Institute

2012 Forest Watch Deforestation Alerts in the Bugoma-Budongo Corridor REDD project area

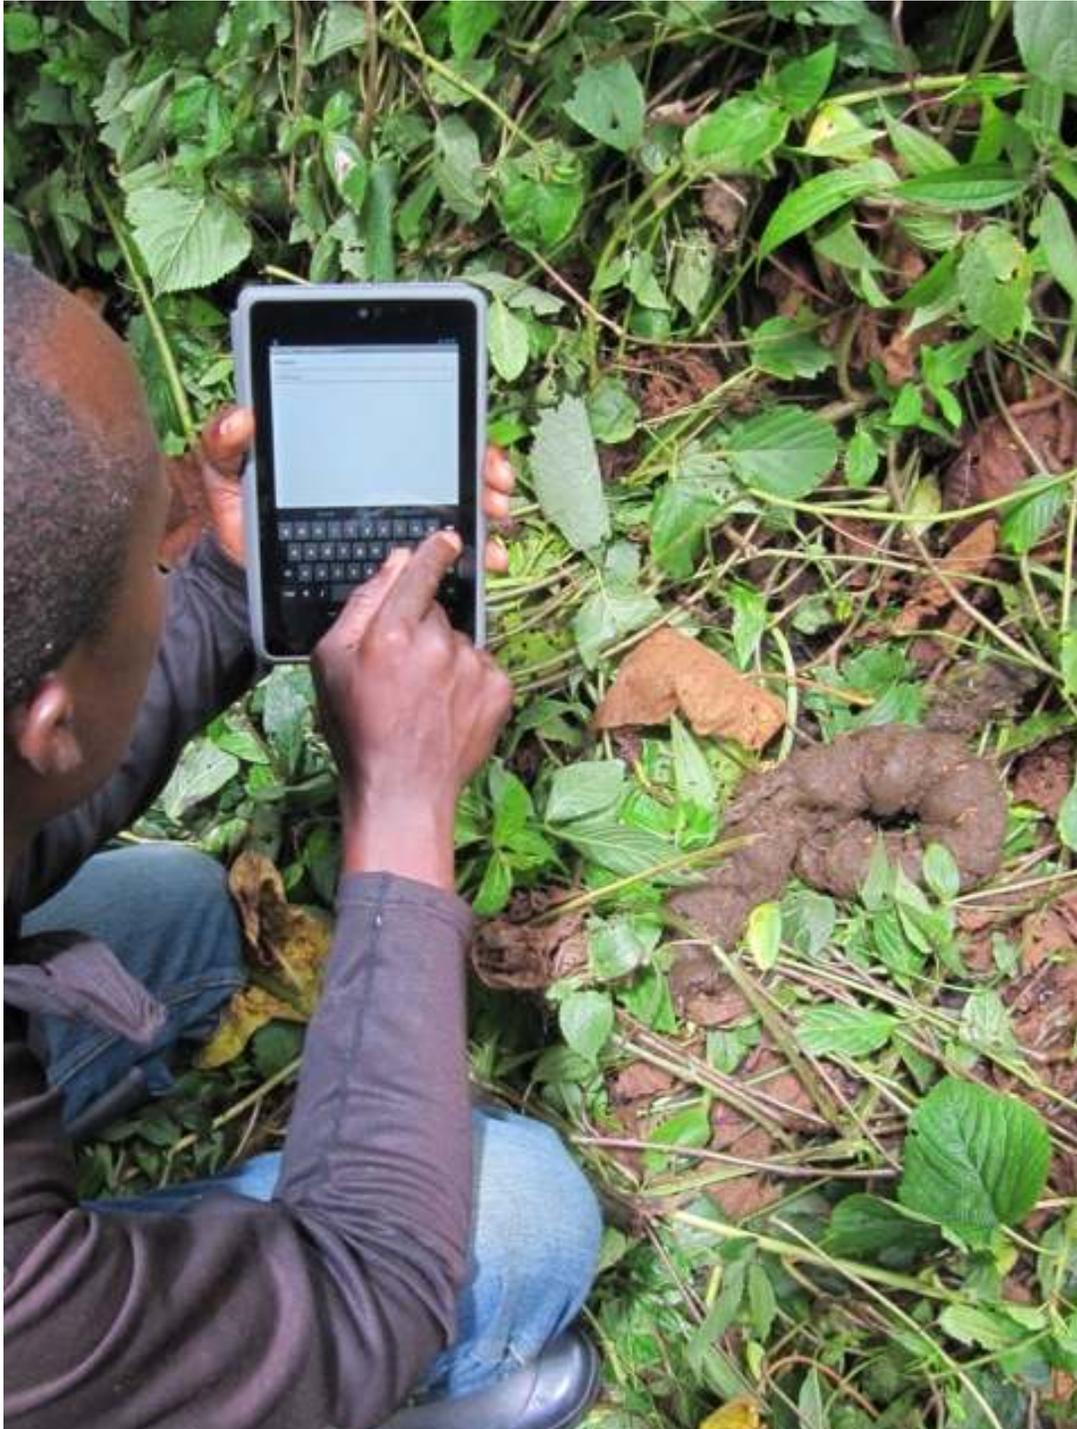

Key Successes & Lessons Learned

- Community generated data key
 - Informed, objective and transparent communication
- New threats identified and addressed
- Community generated data useful for modeling chimpanzee distribution and monitoring threats
- Baseline data to monitor and measure success at the community and regional level
- Great potential to integrate community generated data in the cloud with other applications and efforts:
 - Chimp distribution modeling
 - Using and validating global mapping and monitoring data from satellite images
- Even if technology is straightforward there is a need for technical personnel in the field to address ongoing technology issues (e.g. system updates)
- Need for a local sustainable business solution to battery/power challenge
- Need to access internet by the communities directly
- Understanding local cultures, decision-making processes and policies key to technology adoption
